User installation guide

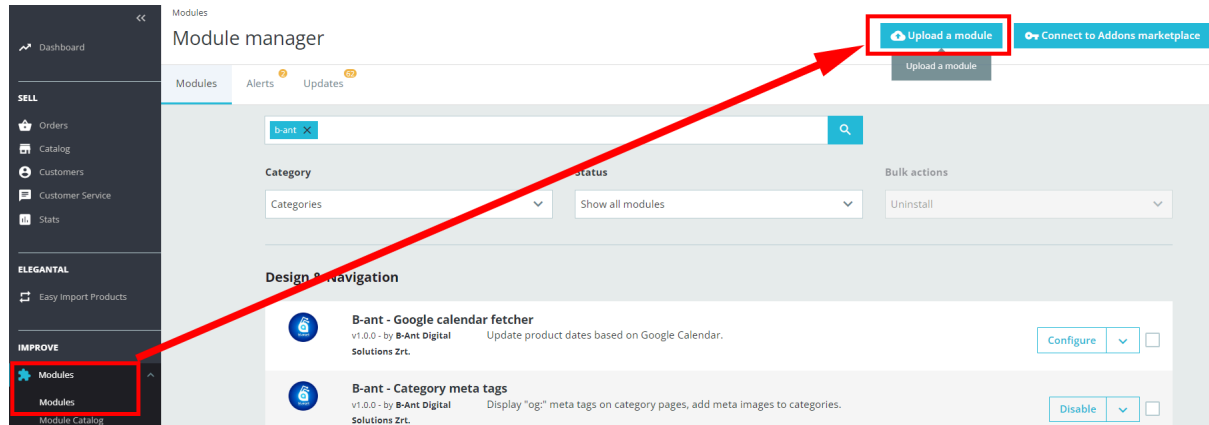

To install the module in your Prestashop store, you have three convenient options:

****Important Note for Second Installations/Reinstallations:** If this is not the first time you are installing this module in your store and you are reinstalling it, you need to be aware that if you have changed the texts of the MACROS in your Gorgias account, you should make a backup as this new installation will delete the previous macros and install them again, removing any customization you have made.

Option 1 - Connect your online store to your Addons account and download it from there.

For Options 2 and 3, you can download our free module from this URL:
<https://addons.prestashop.com/es/pago-tarjeta-carteras-digitales/46347-prestashop-checkout-built-with-paypal-.html>

Option 2 - Upload the .Zip file from your Prestashop back office by navigating to Modules > Modules and clicking the “Upload module” button in the top right corner:

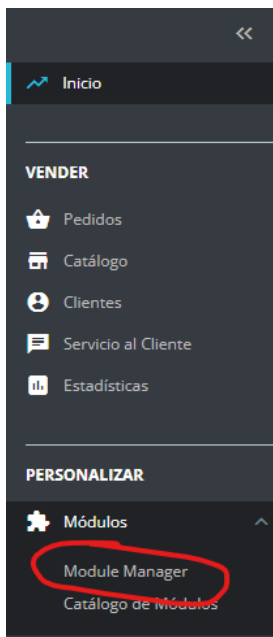

Once uploaded, proceed to step 3 of the installation steps found below

Option 3 - Upload the content to the server via FTP. First, extract the files and upload them to the [modules] folder via FTP, then follow all the steps.

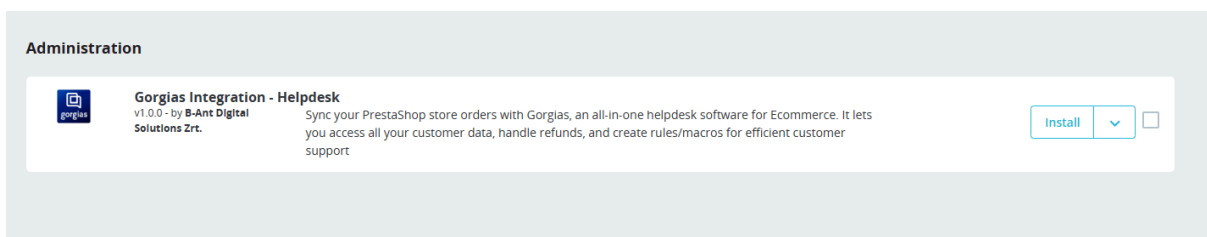

Installation Steps:

- 1) Go to the Prestashop BackOffice.
- 2) Navigate to the main menu option Modules

3) Then, in the sub-option Module Manager.

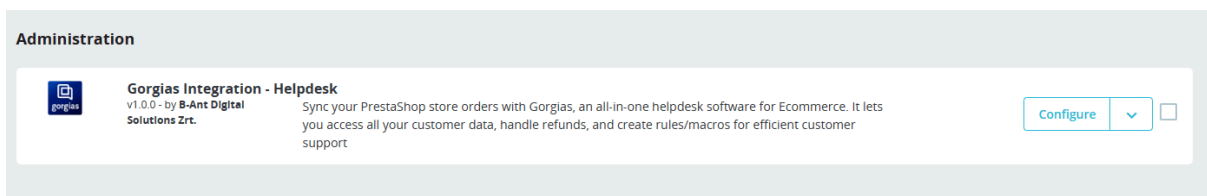

4) Search for the module “Gorgias Integration” and select Install.

Nota: If you do not have the ZipArchive component on your web server PHP, you must manually extract the "installPack.zip" in the administration folder via FTP.

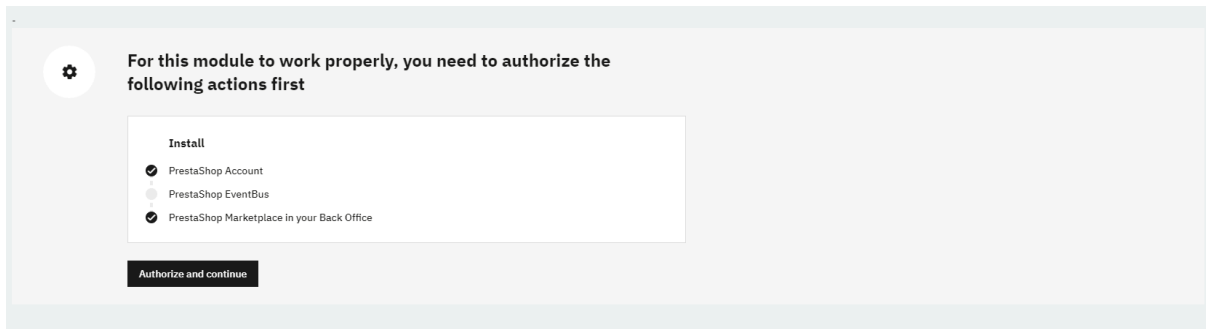

5) Once installed, select the option to configure the module.

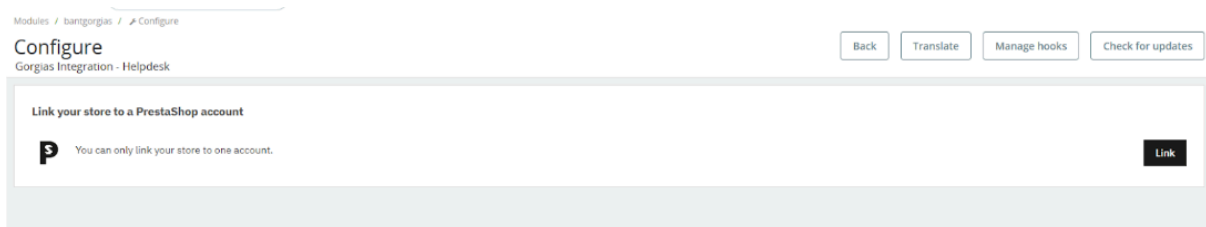

6) If you don't have the following modules installed you will need to click on the 'Authorize and continue' button so the module installs the required Prestashop modules:

- ps_accounts

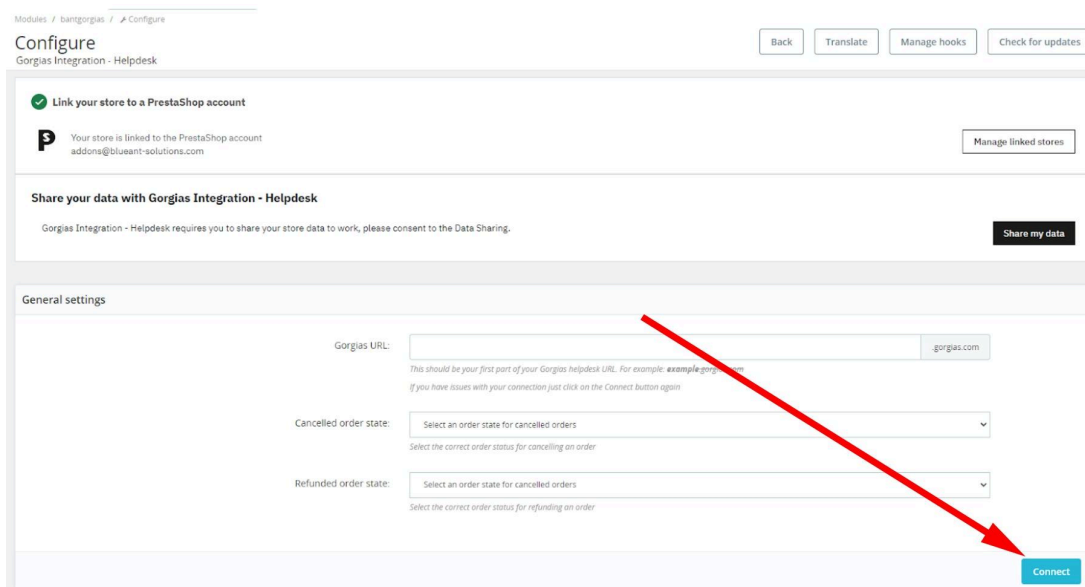

- ps_eventbus
- ps_mbo

7) You will access the back office where you can link your PS Addons account to the store (if you haven't already):

8) After you've linked your Prestashop account you will see the fields to connect your Prestashop with your Gorgias.
From here, you only need to select which statuses in your store correspond to **canceled** and **returned** orders in the corresponding dropdowns, and finally, link the module with your Gorgias subscription by adding your Gorgias account URL in the "Gorgias URL" field.

9) During the installation, our module automatically adds specific configuration lines to the .htaccess file on Apache servers. This ensures the proper functioning of our module. The following lines are added:

```
SetEnvIf Authorization "(.*)" HTTP_AUTHORIZATION=$1
```

This line is crucial for handling the Authorization header and is included automatically if the .htaccess file exists. If you encounter any issues with the Gorgias APP, you should check if the line was correctly added to your .htaccess file manually by following these steps:

- Open the root directory of your website via FTP.
- Locate the .htaccess file. If it does not exist, your server might be using Nginx; read below about it.
- Verify that the following line is present:

```
SetEnvIf Authorization "(.*)" HTTP_AUTHORIZATION=$1
```

- If the line is not present, add it at the end of the .htaccess file.
- Save the changes to the .htaccess file.

For Nginx servers, the equivalent configuration must be manually added to the Nginx configuration file. As our module currently focuses on Apache servers for automatic configuration, follow the documentation provided below for the Nginx equivalent:

```
location / {  
    if ($http_authorization ~ "(.*)") {  
        set $http_authorization $1;  
    }  
}
```

Functionality

Our module automatically installs the application in your Gorgias account, and you can see it in your active applications:

- Access your Gorgias control panel
- Settings > APP Store > My APPs

If you cannot find the application installed on the Gorgias dashboard, you should go back to your Prestashop module and click the "Connect" button again.

Important Note for Second Installations/Reinstallations: If this is not the first time you are installing this module in your store and you are reinstalling it, you need to be aware that if you have changed the texts of the MACROS in your Gorgias account, you should make a backup as this new installation will delete the previous macros and install them again, removing any customization you have made.

What does the PrestaShop APP do for you?

This app syncs order and user data between your PrestaShop store and your Gorgias account, and it also adds **macros** and variables to automate communication with customers. This means that when you receive a ticket from a user registered in your PrestaShop store, their data and orders will be visible on the right side of the ticket in Gorgias, enabling faster and more efficient customer service.

Initial Synchronization:

If it's the first time you're using tickets with the app installed and you notice that no user or order data is synchronized, it's likely because no event has triggered a data update yet. The solution is simple: perform any action on the ticket, which will trigger an event in our app and fetch the user's data and their orders. This only happens with tickets that were already open before installing the app.

Features and information on your Gorgias Tickets from Prestashop:

Here's an example of the information you can see in the Gorgias sidebar when reviewing communication with a specific customer:

The screenshot displays the Prestashop order management interface. On the left, the customer information for 'Mr. John DOE #2' is shown, including email, account registration date, shipping and invoice addresses, and a private note. The main section shows the product list with columns for Product, Base price, Quantity, Refunded, Available, and Total. A table lists the products, including 'Brown bear cushion Color : Black' with a quantity of 1 and a total price of 18.90€. The order summary on the right shows the Order Total Amount as 924.00 €, Order Total Count as 15, and the specific order details for order ID 5 (KHWLILZLL), including the order date, status (Canceled), shop URL, total amount (27.30€), customer ID, name, email, guest status, tracking number, shipping address, and billing address.

- **Total Order Amount:** The total value of orders placed by the customer.
- **Order Total Count:** The total number of orders placed by the customer.

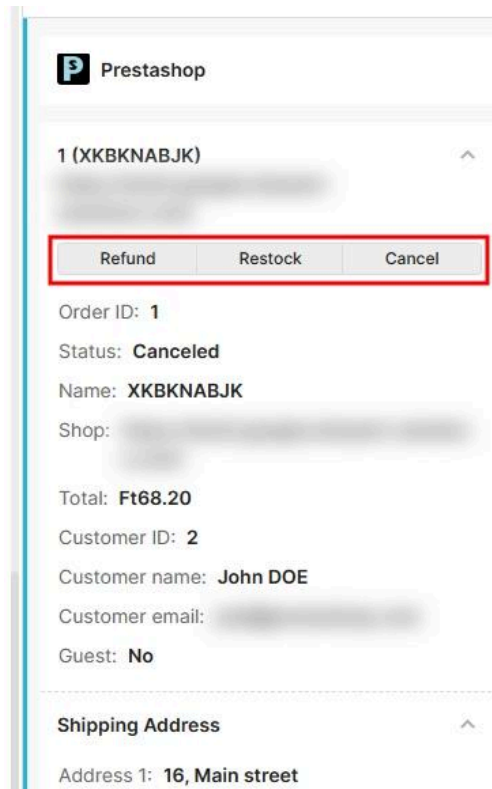

Below this information, you will find a list of orders, displayed in light blue in the image. For example:

5 (KHWLILZLL) > These data refer to the PrestaShop order ID (5) and the PrestaShop order reference code (KHWLILZLL).

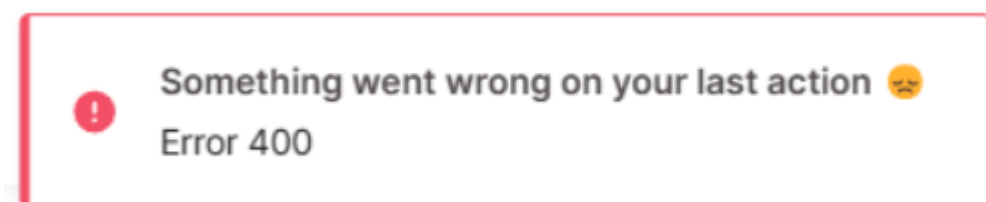

The screenshot shows the Prestashop order management interface with a red arrow pointing from the order ID and reference code '5 (KHWLILZLL)' in the top right corner to the order details section on the left. The order details section shows the order status as 'Canceled' and the order date as '07/19/2024 at 14:48:32'.

For Each Order, the Following Information and Actions are Available:

- Action Buttons:

- **Refund:** This action will initiate a refund (not synchronized with your bank account) in PrestaShop. *Make sure you have this option enabled in your store for it to work correctly.*
- **Restock:** Similar to the previous action, it processes a refund and, if the order status in PrestaShop allows, it will restock the items, returning them to inventory. *Due to technical limitations, it is possible that this action may not restore inventory in some cases, and Gorgias will show a message like this:*

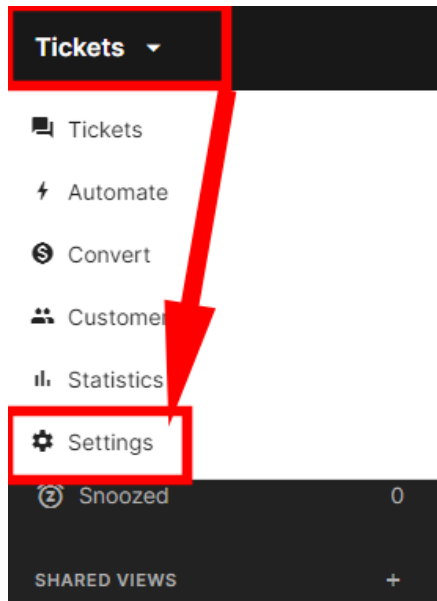

We hope that in future versions, with the help of the Gorgias and PrestaShop teams, we can address this issue to display a clearer error message.

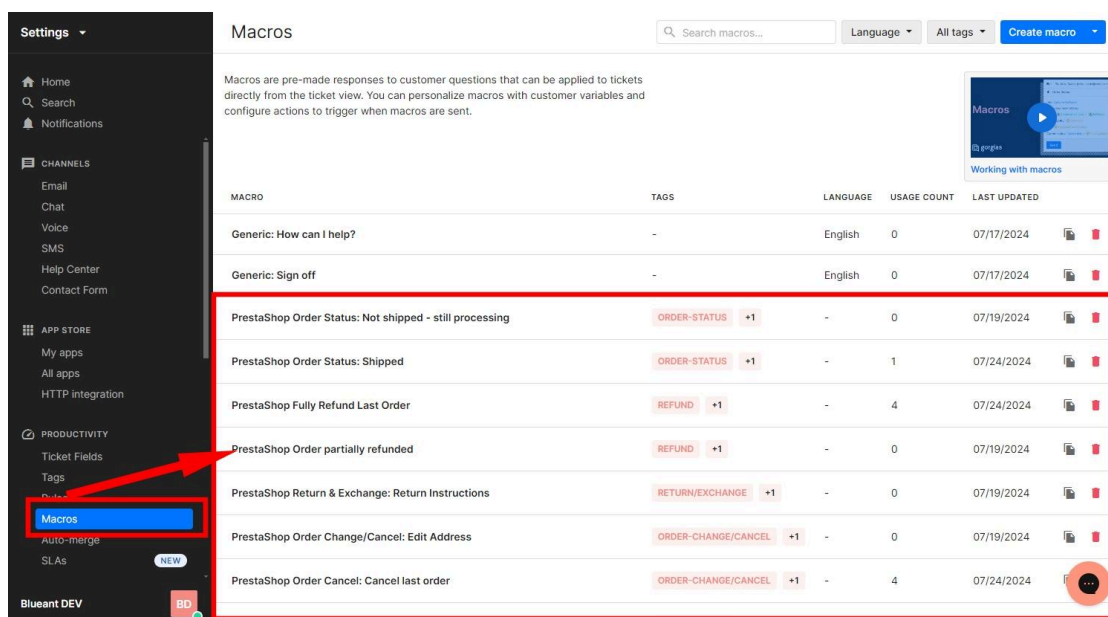

- **Cancel:** This option cancels orders in your PrestaShop store.
- General Order Information:

- Order ID
- Order date
- Order status
- Store from which the order was received (useful if you have more than one store connected to your Gorgias account)
- Total order amount
- Customer ID in PrestaShop
- Customer name
- Customer email
- Indication of whether the customer is registered or a guest
- Carrier number or reference for tracking (this information is provided by default by PrestaShop and does not reflect integrations with third-party solutions).
- Shipping and billing address information
- Billing address information
- Products and quantities included in the order

In this new version, in addition to having all this information about the customer and their orders, we have added default **macros** that will help you automate responses to customers. For more information on how to use macros in Gorgias, you can visit their official documentation [here](https://docs.gorgias.com/en-US/articles/macros-18381) (<https://docs.gorgias.com/en-US/articles/macros-18381>).

To find the macros we've generated, go to your Gorgias Dashboard. In the top dropdown menu, select the "Settings" option. Then, in the right-hand menu, select "Macros." This will display a list of the macros available in your account. The ones related to PrestaShop orders are identified with the prefix "Prestashop" in their name.

For more information on how to manage your tickets in Gorgias, you can review their official documentation:

New on this release

Gorgias chat:

You can integrate your Gorgias Chat script into your PrestaShop store.

Simply copy the installation script into the Chat Script textarea and click the Connect button to complete the setup. Once connected, the chat widget will appear for customers on your website.

Refunded order state: Refunded 

Select the correct order status for refunding an order

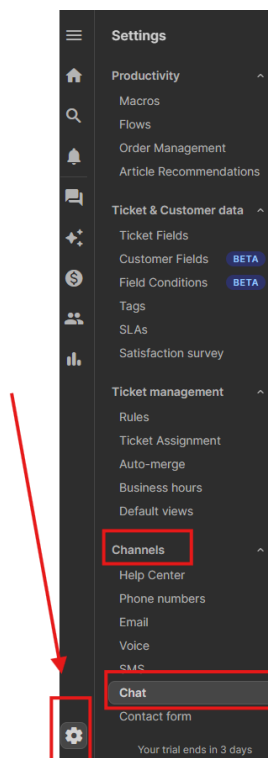

Chat script:

```
<!--Gorgias Chat Widget Start-->
<script src="https://config.gorgias.chat/bundle-loader/[REDACTED]" type="text/javascript"><!--><!--><!-->
[CDATA[//><!--

//--><!--><!--></script>
<!--Gorgias Chat Widget End-->

<!--Bundle Start-->
<script src="https://bundle.dyn-rev.app/loader.js" type="text/javascript"></script>
<!--Bundle End-->
```

Where can you find your chat script to use on our module in Gorgias dashboard?

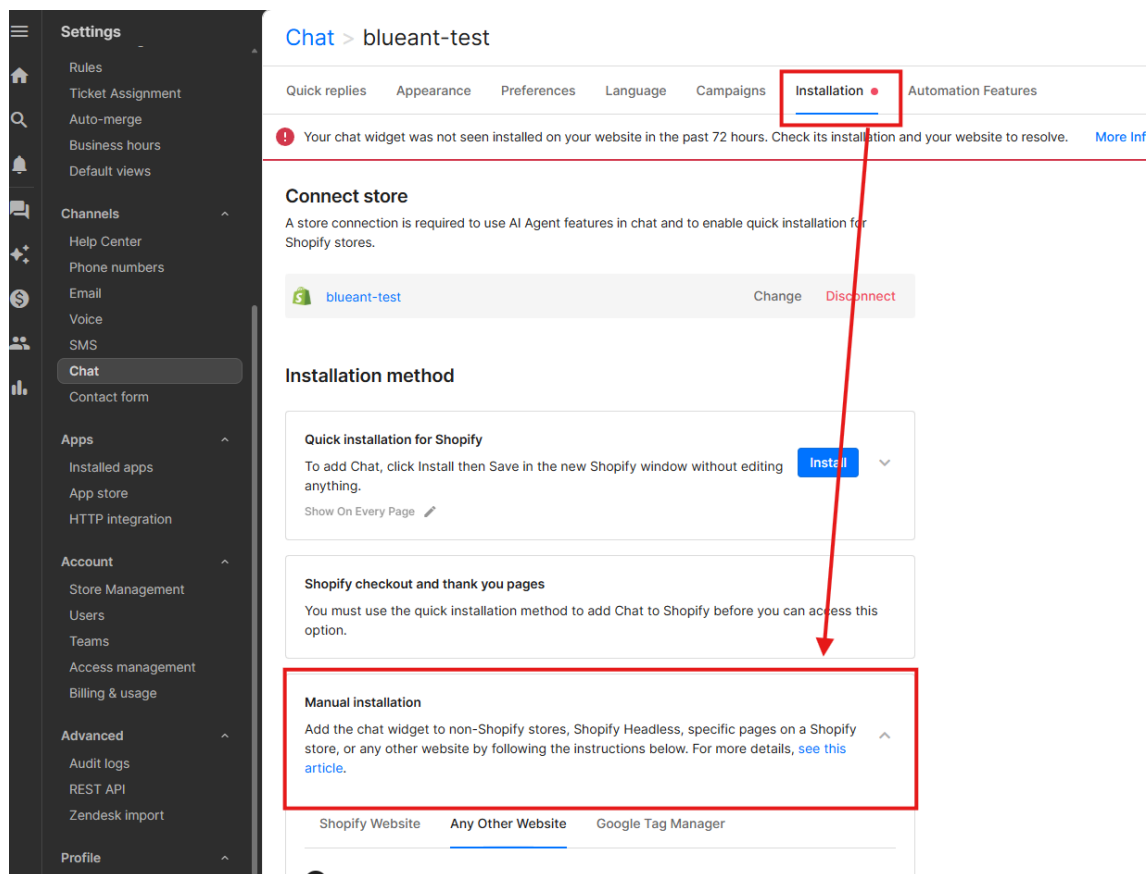

You need to go to the sidebar menu options:

Settings > Channels > Chat

Once you arrive at the Chat set up page.

If you didn't do it before, you must set up the chat with the different options, here you can see the official documentation about it: Gorgias chat page <https://docs.gorgias.com/en-US/set-up-chat-81789>

Once is done, you can visit the Installation tab, and on the Manual installation section:

There choose the Any other website, then you can see the code on the point 3:

Manual installation

Add the chat widget to non-Shopify stores, Shopify Headless, specific pages on a Shopify store, or any other website by following the instructions below. For more details, [see this article](#).

Shopify Website

Any Other Website

Google Tag Manager

- 1 Edit the source code of your website and find the closing HTML tag `</body>`
- 2 Above the `</body>` tag, paste the code snippet below
- 3 Save and publish the changes

```
<!--Gorgias Chat Widget Start-->
<script id="gorgias-chat-widget-install-v3"
      src="https://config.gorgias.chat/bundle-loader-"
</script>
<!--Gorgias Chat Widget End-->

<!--Bundle Start-->
<script src="https://bundle.dyn-rev.app/loader.js?g_cvt_
9c86a39f31" async></script>
<!--Bundle End-->
```

Copy Code

Please note that by inserting this snippet on your webpage, it will load the chat on that specific webpage only. Make sure to insert the snippet on all the pages for which you wish to display the chat widget.

Basic authentication functionality:

If your website is protected with basic authentication, you can enter your username and password in the module to test the PrestaShop widget within your Gorgias tickets.

Simply fill in the relevant fields and click the Connect button to complete the setup.

Authentication popup user:

Authentication popup password:

F.A.Q

How do I install my application in my Gorgias account?

First, you need to install our Prestashop module. This module will create your application in your Gorgias account.

What are the consequences if I delete my application in my Gorgias control panel? What steps should I follow to reinstall it?

From our Prestashop module control panel, if you click the "Connect" button again, it will check if the application exists in Gorgias, so don't worry. We kindly ask that you do not install the application from Gorgias.

At this point, we must remind you that if you perform this action, any modifications you have made to the MACROS will be lost, and you will need to redo those modifications. A solution would be to back up these macros by copying them to a safe place from which you can later restore them.

What happens if I delete my module from my Prestashop store?

Nothing will happen because the module is associated with your account and your store, so when you reinstall it, it should work normally. Only you have to provide again all of the information and click on the "Connect" button. Additionally, our module will recreate the link with your application in Gorgias.

Can I migrate my module to another Prestashop store of mine?

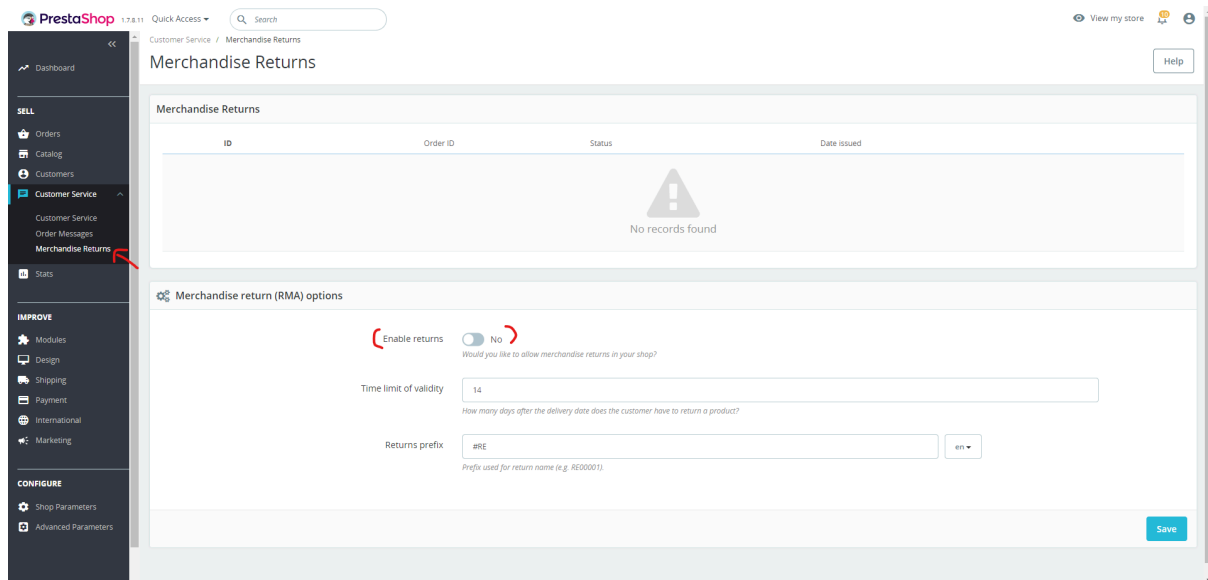

The module is associated with a domain, so you will need to install the module again in that store for the relationships with your Gorgias account to be correctly established.

What happens if I exceed the monthly ticket limits in my plan?

Remember that Gorgias is an independent service, and this is something to be managed directly with Gorgias. There are different plans that adapt to your regular use.

What do I need to do to be able to use the Refund functionality in the widget?

You have to enable the merchandise returns in Prestashop:

Updating Your Prestashop Module and Gorgias App to the Latest Version

This is a straightforward step to be carried out from the control panel of the Prestashop module.

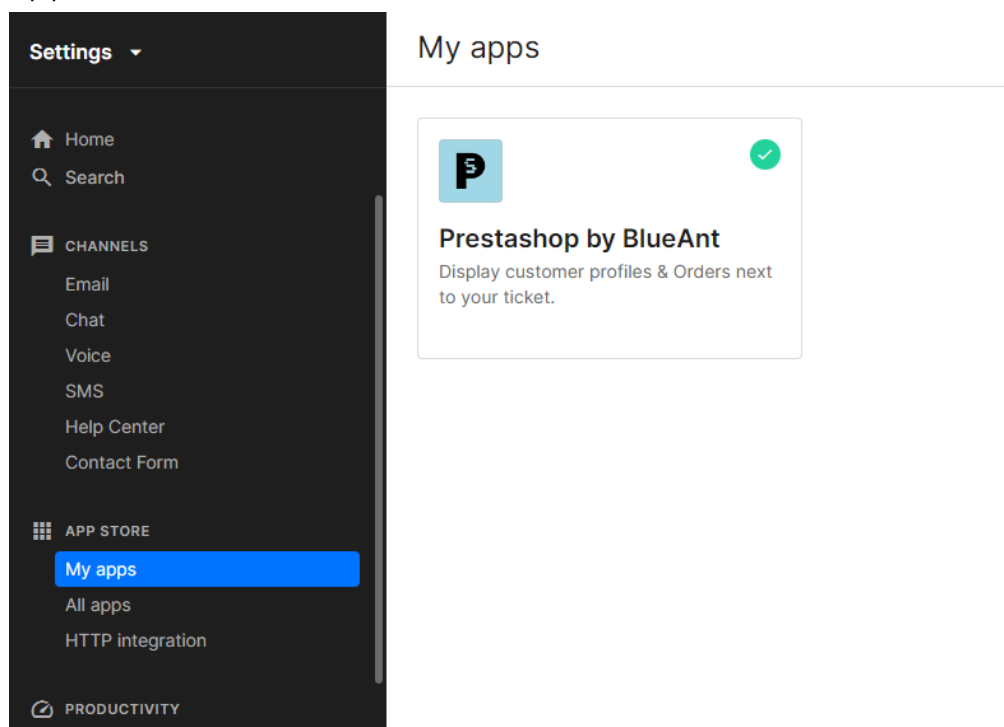

The steps are as follows:

- **Update Prestashop Module Version:** Check in the module list if there is a newer version available. If so, you will see that the configuration button has changed to an update button, in case you can not see, please download the latest version and install it again.
- **Access the Latest Version:** Once you have the latest version, go to the control panel.
- **Review and Configure New Features:** Check for new functionalities and set them up as needed. For example, in version 1.0.4, we added fields to define the order status in your store for canceled or returned orders.
- **Reconnect the App:** Finally, click the '**Connect**' button again. This will update your app in your Gorgias control panel.

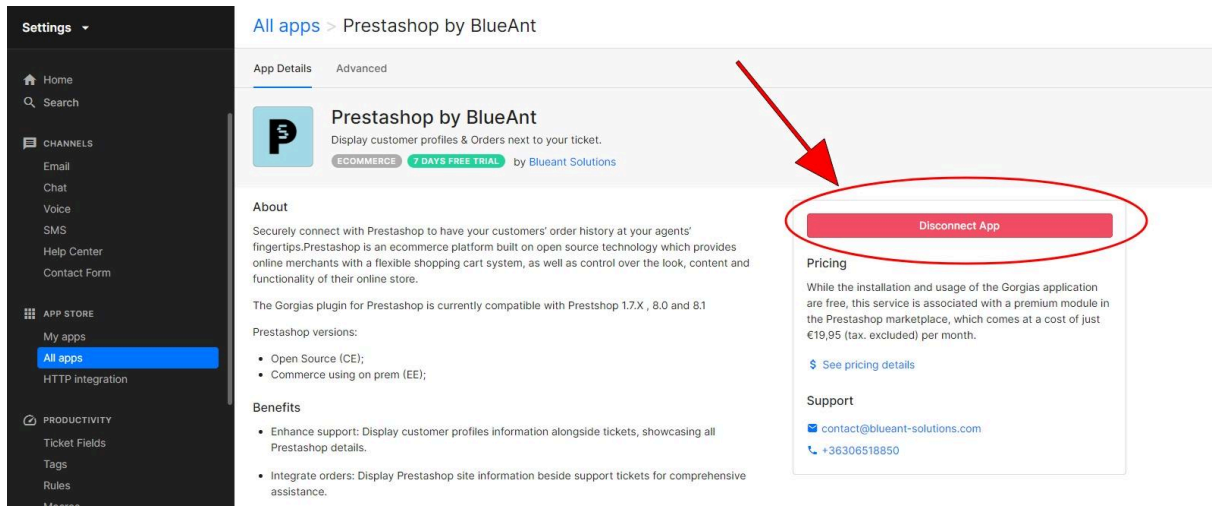

Fixings issues - Removing APP from your Gorgias Account

If you are encountering problems when syncing your Prestashop data with your Gorgias account, it may be due to the Gorgias APP not being correctly synchronized with your Prestashop module. These steps will help you resolve this issue:

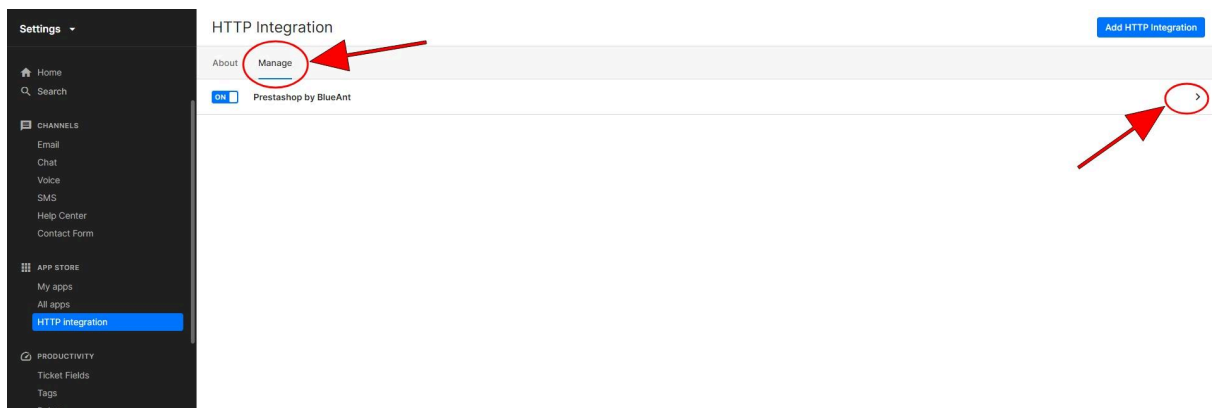

- From your Gorgias control panel, go to My Apps and there select our Application:

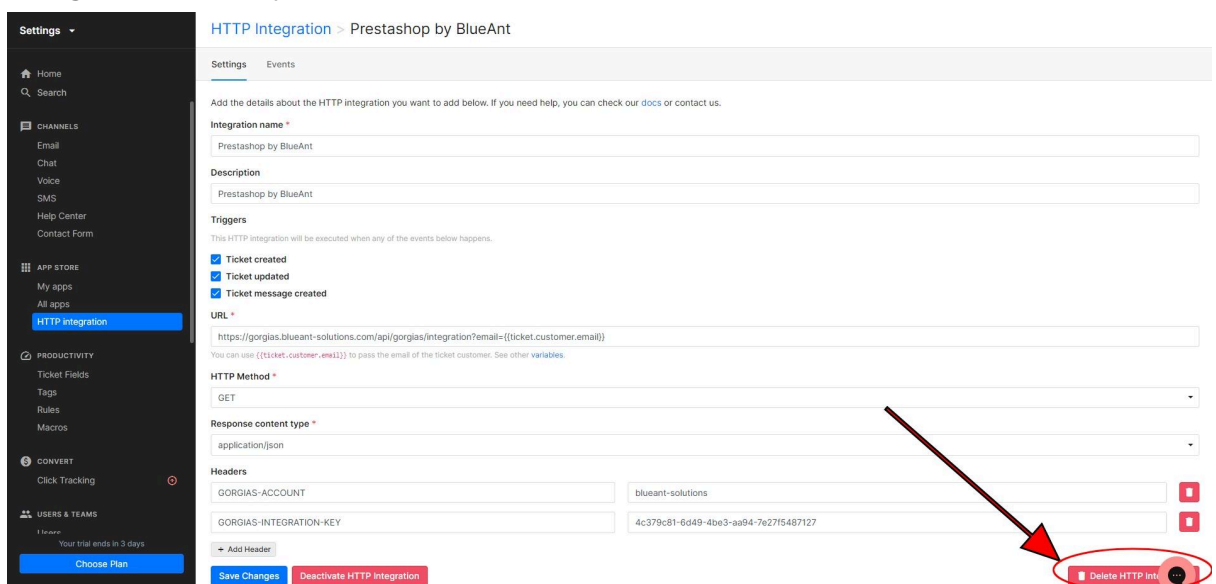

- Upon accessing it, click on the “Disconnect APP” button:

- Once disconnected, navigate to the main menu option “APP Store” > “HTTP integration” and there select the “Manage” tab, and in the line of our application “Prestashop” click on the arrow to enter the details:

- And look for the button at the bottom right of “Delete HTTP integration” and proceed to delete it.

In this way, we can create the app again from scratch using the “Option 1” of this same document.
